## Chapter 2

2.40) Given the traveling wave  $\Psi(x, t) = 5.0\exp(-ax^2 - bt^2 - 2\sqrt{ab}xt)$ , determine its direction of propagation. Calculate a few values of  $\Psi$  and make a sketch of the wave at  $t = 0$ , taking  $a = 25m^{-2}$  and  $b = 9.0s^{-2}$ . What is the speed of the wave?

After factoring notice that  $\Psi = 5.0\exp(-(x + \sqrt{\frac{b}{a}}t)^2)$ . Thus, the direction of propagation is in the **negative x direction**.

The following is  $\Psi$  as  $x$  varies.

x	$\Psi$
0.6	0.0006
0.4	0.09
0.2	1.8
0.0	5.0
-0.2	1.8
-0.4	0.09
-0.6	0.0006

Let  $t = 0$ ,  $a = 25m^{-2}$ , and  $b = 9s^{-2}$ . Then  $\Psi = -5.0\exp 25x^2$ .

Below is a graph of  $\Psi$  at time  $t = 0$ .

$\Psi$  is a function of  $(x + vt)$ , where  $x + vt = (x + \sqrt{\frac{a}{b}}t)$ . Thus, the speed of the wave is  $v = \sqrt{\frac{a}{b}} = \sqrt{\frac{9m^2}{25s^2}} = \frac{3m}{5s} = 0.6ms^{-1}$ .

2.44) Working with exponentials directly, show that the magnitude of  $\Psi = Ae^{i\omega t}$  is  $A$ . Then, rederive the same result using Euler's formula. Prove that  $e^{i\alpha}e^{i\beta} = e^{i(\alpha+\beta)}$

Let  $\tilde{z} = Ae^{i\omega t}$  and its conjugate  $\tilde{z}^* = Ae^{-i\omega t}$ . Let the modulus, or magnitude, of  $\tilde{z}$  be  $\|\tilde{z}\| = (\tilde{z}\tilde{z}^*)^{\frac{1}{2}}$ . Thus, the magnitude of  $\Psi$  is  $\|\tilde{z}\| = (\tilde{z}\tilde{z}^*)^{\frac{1}{2}} = [(Ae^{i\omega t})(Ae^{-i\omega t})]^{\frac{1}{2}} = [A^2e^{i\omega t - i\omega t}]^{\frac{1}{2}} = \sqrt{A^2} = A$ .

Euler's formula states that  $e^{i\omega t} = \cos \omega t + i \sin \omega t$ . Notice that  $\omega = 2\pi\nu = \frac{2\pi}{t}$ . Plugging this in yields  $Ae^{i\frac{2\pi}{t}t} = A[\cos \frac{2\pi}{t}t + i \sin \frac{2\pi}{t}t]$ .

If  $t = \tau$ , then  $Ae^{i\frac{2\pi}{\tau}\tau} = A[\cos \frac{2\pi}{\tau}\tau + i \sin \frac{2\pi}{\tau}\tau] = Ae^{2\pi} = A[\cos 2\pi + i \sin 2\pi] = A[1 + 0] = A$ .

By law of exponents,  $e^x + e^y = e^{x+y}$ .

Thus,  $e^{i\alpha}e^{i\beta} = e^{i\alpha+i\beta} = e^{i(\alpha+\beta)}$ .

2.49) Show that  $\Psi(x, y, z, t) = f(\alpha x + \beta y + \gamma z - vt)$  and  $\Psi(x, y, z, t) = g(\alpha x + \beta y + \gamma z - vt)$  which are plane waves of arbitrary form satisfy the three-dimensional wave equation.

Since  $f$  and  $g$  are functions which are twice differentiable, compute the partial derivatives of  $\Psi$

$$\frac{\partial^2 \Psi}{\partial x^2} = -\alpha^2 k^2 \Psi \quad \frac{\partial^2 \Psi}{\partial y^2} = -\beta^2 k^2 \Psi \quad \frac{\partial^2 \Psi}{\partial z^2} = -\gamma^2 k^2 \Psi \quad \frac{\partial^2 \Psi}{\partial t^2} = -k^2 v^2 \Psi$$

Add the three spatial derivatives  $\frac{\partial^2 \Psi}{\partial x^2} + \frac{\partial^2 \Psi}{\partial y^2} + \frac{\partial^2 \Psi}{\partial z^2} = -k^2(\alpha + \beta + \gamma)\Psi$  and recall that  $\alpha + \beta + \gamma = 1$ . Thus  $-k^2(\alpha + \beta + \gamma)\Psi = -k^2\Psi$ .

Plugging the second partial of  $\Psi$  with respect to  $t$  into the 3-d wave function yeilds  $\frac{1}{v^2} \frac{\partial^2 \Psi}{\partial t^2} = -k^2\Psi$ .

2.46) Take the complex quantities  $\tilde{z}_1 = (x_1 + iy_1)$   $\tilde{z}_2 = (x_2 + iy_2)$  and show that

$$\mathbf{Re}(\tilde{z}_1 + \tilde{z}_2) = \mathbf{Re}(\tilde{z}_1) + \mathbf{Re}(\tilde{z}_2)$$

If  $\mathbf{Re}$  means to extract the real components of a complex number, then since the argument  $\tilde{z}_1 + \tilde{z}_2$  resolves to  $x_1 + iy_1 + x_2 + iy_2$ , another complex number, simply extract the real component. Thus, the real component from  $x_1 + x_2 + (y_1 + y_2)i$  is  $x_1 + x_2$ .

2.47) Take the complex quantities  $\tilde{z}_1 = (x_1 + iy_1)$  and  $\tilde{z}_2 = (x_2 + iy_2)$  and show that  $\mathbf{Re}(\tilde{z}_1) \times \mathbf{Re}(\tilde{z}_2) \neq \mathbf{Re}(\tilde{z}_1) \times \mathbf{Re}(\tilde{z}_2)$ .

2.56) Show explicitly that the function  $\Psi(\vec{r}, t) = A \exp[i(\vec{k} \cdot \vec{r} + \omega t + \epsilon)]$  describes a wave provided that  $\nu = \frac{\omega}{k}$ .

## Chapter 3

3.19) A 1.0 mW laser produces a nearly parallel beam  $1.0\text{cm}^2$  in cross-sectional area at a wavelength of 650nm. Determine the amplitude of the electric field in the beam, assuming the wavefronts are homogeneous and the light travels in a vacuum.

3.21) The following is the expression for the  $\vec{E}$ -field of an electromagnetic wave traveling in a homogeneous dielectric:  $\vec{E} = (-100Vm^{-1})\hat{z}e^{i(kz-\omega t)}$ . Here  $\omega = 1.80 \times 10^{15} \frac{rad}{s}$  and  $k = 1.20 \times 10^7 \frac{rad}{m}$ .

- (a) Determine the associated  $\vec{B}$ -field.
- (b) Find the index of refraction
- (c) Compute the permittivity
- (d) Find the irradiance
- (e) Draw a diagram showing  $\vec{E}_0$ ,  $\vec{B}_0$ , and  $\vec{k}$ , the propagation vector.

3.23) Consider a linearly polarized plane electromagnetic wave traveling in the positive x direction in free space having as its plane of vibration the xy-plane. Given that its frequency is 10MHz and its amplitude is  $E_0 = 0.08Vm^{-1}$ ,

- (a) find the period of the wave
- (b) write an expression for  $E(t)$  and  $B(t)$
- (c) find the flux density,  $\langle S \rangle$ , of the wave.

(a) The period of an electromagnetic wave can be calculated as  $\tau = \frac{1}{\nu} = \frac{1}{10^7 s^{-1}} = 10^{-7}s$ .

(b)  $\lambda = \frac{v}{\nu} = \frac{c}{\nu} = \frac{3 \times 10^8 ms^{-1}}{10^{-7} s^{-1}} = 30m$ .

Since  $E(x, t) = \hat{y}E_0 \cos(k_x x - \omega t) = \hat{y}E_0 \cos 2\pi(\frac{x}{\lambda} - \nu t) = \hat{y}(0.08Vm^{-1}) \cos(2\pi(\frac{x}{30} - 10^7 t))$ .

Recall that  $\vec{B} = \frac{1}{c}\hat{k} \times \vec{E} = \frac{1}{c}\hat{x} \times \hat{y}\|\vec{E}\|$ . Since the wave is propagating in the x direction,  $\hat{k} = \hat{x}$ .

$$\begin{aligned}\text{Thus } \vec{B} &= \hat{z} \frac{0.08Vm^{-1}}{2.998 \times 10^8 ms^{-1}} \cos[2\pi(\frac{x}{30} - 10^7 t)] \\ &= \hat{z}(2.67 \times 10^{-10} Vsm^{-2}) \cos[2\pi(\frac{x}{30} - 10^7 t)] \\ &= \hat{z}(2.67 \times 10^{-10} T) \cos[2\pi(\frac{x}{30} - 10^7 t)].\end{aligned}$$

(c) The flux density is given by  $u = \epsilon_0 E_0^2 = (8.825 \times 10^{-12} \frac{C^2}{Nm^2})(0.08Vm^{-1})^2 = 5.648 \times 10^{-14} Jm^{-3}$ .

The average magnitude of the Poynting vector is  $\langle S \rangle = \frac{c\epsilon_0}{2} E_0^2 = \frac{(3 \times 10^8 ms^{-1})(5.648 \times 10^{-14} Jm^{-3})}{2} = 8.472 \times 10^{-6} Wm^{-2}$ .
